be arguments, input files or data entered by the user.) If all that information is available, then tests can be run to accurately determine if the algorithm is fast enough. But very often, there are no precise time targets to meet. In that case, the safest approach is to choose the fastest algorithm among the available alternatives.

We'll use the former approach, with an adjacency matrix:
Pseudocode: Algorithm: breadthFirstMatrix (adjMatrix, n) Input: A graph's adjacency matrix, number of vertices n. // Visit order will start with "0", so initialize to -1. 1. for i=0 to n-1 2. visitOrder[i] = -1 3. endfor // A counter for the order: 4.

In my (limited) experience, data structures and algorithms are pretty important in the interview process, but not that important to your career success as a developer. If you want to do back-end dev, you definitely need to be aware of these concepts, but you won't be grilled on them, and will be able to google for specific algorithms when you need them for a task.

Data Structures! I'll be posting a new post every week on data structures and this time, it's not for good grades, but to grok the intricacies of data structures which enable efficient algorithmic computations. We'll start right from the basics of Stacks, Queues, Linked Lists and deep dive into Trees & Graphs.
