However, it is also possible to determine the work you do entirely in terms of physical quantities of rotation. If you exert a torque on the rotating object and it rotates the an angle in the direction of your torque, you again do work on the object. That's the rotational version of the work formula: whereas force time distance is the translational work formula, torque times angle is the rotational work formula.

In *How Everything Works: Making Physics Out of the Ordinary*, Louis Bloomfield avoids that trap by taking just as long as he needs to explain things. And that's exactly what he does, explain things, his chapters having such titles as "Things That Involve Light," "Things That Move With Fluids," "Things That Involve Chemical Physics" and so forth. The result is something of a cross between those familiar (and often less-than-satisfying) how-it-works guides and a full-blown physics textbook.

This is NOT a physics book; he simply relates how physics can be used to understand (and myth-bust) things such as microwave ovens, vibration caused by wind blowing through an open car-window, etc. My child has really been enjoying reading this book and we've been able to link it to school's required math homework. I highly recommend.
